

# *Big Life Sports Bar, Fukuoka, Japan*

*with Schweitzer BIM, 1992*

*View to stadium*

This project has been termed, “the world’s longest sports bar” and covers a linear distance of over 200’ while being only 20’ wide. Its location at the end of a sports stadium offers privileged views to fans who want to watch a game and socialize. I worked on schematic design and design development drawings, and was active in the interaction between the architecture and the supergraphics. Once development drawings were completed they were sent to the Japanese contractor who generated complete working drawings that we approved before construction began. The final experience of the spaces was a collaboration of architectural and graphic design disciplines.
